

We are taking you to our Task Round, please find below following task with the attachment.

Description follows -

=====

Here is a task we would like you to do.

- Create a RESTful API for movies(something similar to IMDB). For this we would like you to use:

1. MySql to store data,
2. Django for api(use Django Rest framework).

There need to be 2 levels of access:

admin = who can add, remove or edit movies.

users = who can just view the movies.

- There should also be a decent implementation to search for movies.
- Document your code well so that we can test the API with ease.
- For your convenience I have attached some data that you can use to populate your database.
- Try and deploy this on Heroku.
- Feel free to add features!
